CLOSING LOOPLHOLE ON TREATMENT OF FRACKING WASTE

On May 17, 2020, Senator Rachel May announced that legislation has passed both chambers of the New York State Legislature that will properly categorize hazardous waste from fracking. Senator May is proud of this achievement, and calls on Governor Cuomo to sign the bill into law. The legislation requires that fracking wastes be classified as hazardous waste, which will ensure it is disposed of safely and properly.

“This grassroots anti-fracking movement in New York has proven once again that when we organize together, we win, even against one of the world’s most powerful industries. I am so grateful to my co-sponsors in the State Senate and the New York State Assembly for their leadership in protecting our water and our communities from the toxicity of the under-regulated oil and gas industry. It’s long past time New Yorkers have the right to know the true impact of their decisions on our health and safety,” said Senator Rachel May.

New Yorkers have known, from the very first days of our fight to ban fracking in New York, that the waste from this industry is hazardous and must be disposed of safely. The New York State Legislature now joins states like California and Colorado in requiring that fracking waste be treated as hazardous waste. Today’s victory was a long time coming, as New Yorkers have fought to keep fracking waste out of the state for the better part of a decade.

Senator May’s bill ensures hydrofracking waste will be disposed of safely and properly, which will protect our waterways from the toxic impacts of the under-regulated oil and gas industry. It’s long past time New Yorkers have the right to know the true impact of their decisions on our health and safety.
